

The solar system consists of the Sun, eight planets, and many smaller objects. The planets are Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, and Neptune. The Sun is a star that provides the energy for life on Earth. The planets orbit the Sun in elliptical paths. The inner planets (Mercury, Venus, Earth, and Mars) are rocky and have solid surfaces. The outer planets (Jupiter, Saturn, Uranus, and Neptune) are gas giants and do not have solid surfaces. The solar system also contains many smaller objects, including asteroids, comets, and dwarf planets. The solar system is located in the Milky Way galaxy, which is a spiral galaxy. The Milky Way galaxy is one of billions of galaxies in the universe. The universe is expanding, and galaxies are moving away from each other. The solar system is a small part of the universe, but it is the only one we know of that has life.

The solar system is a collection of celestial bodies that are gravitationally bound to the Sun. The Sun is the central body, and it is a star that is made of hydrogen and helium. The Sun's gravity holds the solar system together. The planets are the largest objects in the solar system, and they are made of rock and gas. The planets orbit the Sun in elliptical paths. The inner planets (Mercury, Venus, Earth, and Mars) are rocky and have solid surfaces. The outer planets (Jupiter, Saturn, Uranus, and Neptune) are gas giants and do not have solid surfaces.
